Online voting system

→ Process :

people come
they vote
system counts
end : results are shown

} general or common process

→ creating class :

• we keep person as class because everyone is a person. They have a name and ID.

→ voter
→ candidate
→ Election commission

} types of persons.

voter → casts votes
candidate → has the no. of votes
voting system → counts, shows results, etc

→ Flow of work.

• we create the election system.
• then the candidates are added
• voters are created
• they initially are not voted so hasvoted = false
• person votes → checks for hasvoted() or not.
• if false mark and change the count and change false to true.
• if he / she tries again it will show already voted
• Then results will be shown

→ OOPS concepts used:

- abstraction: only needed info is showed
- inheritance: voter & candidate use person's data
- Encapsulation: Data is hidden using private
- polymorphism: displayRole() function is behaving differently (we override)
